MedAdherence

MedAdherence has two key products, CarePlanManager™ and TransCareManager™. CarePlanManager is designed to monitor, manage and automatically intervene (notify doctor, provide instructions based on the doctors orders, send relevant educational messages and notify and connect to a health care professional) with patients that have conditions that require continuous care (chronic diseases such as diabetes, asthma, COPD etc.). TransCareManager leverages the same technology to help patients transition from acute care facilities into ambulatory care settings or their homes (CHF, Stents, gastric bypass and any post operative care requirements). Both products assist patients with compliance with their healthcare professionals' instructions and help alert the HCP to any pending issues or complications. Conditions covered by this product include Congestive Heart Failure, Lap Band Surgery, Smoking Cessation and Weight Management.

These products use pervasive communication channels and devices such as a cellular phone, and can support Interactive Voice Response (IVR), SMS text messaging, email and web-services combined with a patent-pending decision support engine to interact with patients/caregivers in an automated, intelligent two-way dialogue. These interactions promote timely responses and interventions and assist patients with following their care plans.

Another key benefit to using the MedAdherence platform is that the provider can brand this service as its own and become part their health care professional normal care processes. More importantly, MedAdherence takes their customers "care plans" and practices and automates them using the MedAdherence platform.
